

ProtoWizard Jewelry Fixtures

ProtoWizard's Fixture Kit includes the ProtoWizard Flip Fixture, Ring Arbor Fixture, Ring Tube Fixture, the Extension Supports and the Head Inserts. All of the fixtures are manufactured in the U.S.A from aircraft grade aluminium. High Precision accuracy is achieved using state-of-the-art CNC equipment.

Flip Fixture

ProtoWizard's Flip Fixture has 2 purposes...

1.

Machine Top and Bottom as with both faces of the ring...

2.

Flip the fixture up and machine +/- 60 degrees in both directions

With the 3-Sided Ring Fixture, rings with top only detail can be created without ever removing the wax from the fixture.

Ring Arbor

ProtoWizard's Ring Arbor has a unique triangular shape on the tip to locate the ring straight up every time. Positioning the ring is mistake-free with ProtoWizard. ProtoWizard's Core and Supports eliminate the guess work. Use ProtoWizard's Ring Arbor to cut those fine details 360 degrees around the ring.

Ring Tube Fixture

ProtoWizard's Ring Tube Fixture locates on the center hole of the Ring Tube wax. Use any style or size of wax. Presize the hole and use ProtoWizard's Supports to eliminate the time consuming clean up.

Extension Supports

Extend the cutting area for longer pieces such as Ear Rings or Pendants using the ProtoWizard Extension Supports with the Flip Fixture. Made from precision aluminum, the Extension Supports have little "ears" out on the end to compress and stiffen the wax. This eliminates bending or warping of the wax.

Head Inserts

Need to machine complex piercing around the bezel? The ProtoWizard Head Inserts center a 7/8" wax rod for both top down and well as full 360 degree rotary machining. With the Head Inserts, you can machine detail not reachable by conventional 3-Sided milling.

Call today and start being more productive with ProtoWizard.
