

FILTER BAG – VMC-A400

Filter Bag Replacement – When a noticeable drop in suction occurs with a Vaniman dust collector, it is likely time to change the filter bag. **CAUTION: Operating the dust collector with a plugged filter bag can cause permanent damage to the motor.** Remove the two screw knobs on the front of the dust collector and remove the front cover plate exposing the filter bag. Check the inside of the filter cavity. If dust is present, it may be that the bag was torn when installed or the seal around the inlet tube was not correct. Vacuum out any dust before putting in a new bag. This will save wear-and-tear on the motor.

To install a new filter bag, first slip the cardboard reinforcement, with rubber seal, over the inlet tube. Tilt the front of the cardboard downward and slip the back edge up past the tube end; then rotate the front edge upward over the tube end. Look into the top of the inlet tube to make sure that the rubber seal is completely seated. Carefully tuck the edges of the filter bag into the filter cavity. Replace the cover plate and gently tighten the screw knobs.
